10.	Time-Series Traffic Analysis	12
11.	Visualisations Gallery	13
12.	Business Insights (10 Findings)	15
13.	Five Strategic Recommendations	16
14.	Data Limitations & Transparency	17
15.	Conclusion & Action Roadmap	17

1. Executive Summary

This report presents a comprehensive analysis of smartlink landing-page traffic for **Alfido Tech**, conducted as part of the InternSpark Data Analytics Internship. The original dataset covers **one week of web-log events** (19–25 August 2021), capturing three types of user interactions — pageviews, audio previews, and outgoing store clicks — across smartlink pages that artists use to distribute music to streaming platforms (Spotify, Apple Music, Deezer, etc.).

103,616 Total Sessions	32,993 Unique Users	67,310 Page Views	27,632 Store Clicks
61.94% Bounce Rate	25.71% Conversion Rate	39.9 Avg Session (sec)	6,959 Returning Users

Major Findings at a Glance

- Social Media drives the highest session volume (43,988 sessions / 40.1%) among all traffic categories.
- Bounce rate stands at 61.94% — indicating more than half of sessions consist of a single pageview.
- Average session duration is only 39.9 seconds, suggesting most visitors do not deeply engage with content.
- Conversion rate of 25.71% shows that roughly 1 in 4 sessions ends in a store click — a healthy funnel outcome.
- The United States (25,942 events) and India (16,283 events) are the top two geographic markets.
- Mobile devices account for 59.9% of all events; mobile experience is the primary engagement surface.
- Peak traffic hour is 19:00 (7 PM); Thursday is the highest-traffic day of the week.
- The homepage ('/') is both the #1 landing page (16,164 sessions) and the #1 exit page (16,170 sessions).

Five Strategic Priorities

1. Reduce bounce rate through faster page loads and prominent above-the-fold preview players.
2. Improve content depth: add related artist/track recommendations to retain users beyond one page.
3. Schedule campaigns at 19:00–21:00 on Thursdays and Fridays for maximum reach.
4. Geo-localise smartlinks for top markets (US, India, France) with region-appropriate store buttons.
5. Invest in Social Media creatives (Instagram/Facebook) as the highest-volume acquisition channel.

2. Dataset Overview & Technical Details

The raw dataset (traffic.csv) was sourced from **Kaggle** (bhanupratapbiswas/website-traffic-analysis) and contains **122,567 rows** across **9 columns**. After deduplication and enrichment the analysis dataset comprises **108,723 rows** and **19 columns**. All events occurred within a single week: **19–25 August 2021**, covering **212 countries**, **11,993 cities**, and **2,420 unique artists**.

Original Dataset Column Descriptions

Column	Type	Description
event	object	Type of interaction: pageview, preview, or click (outgoing store link)
date	object	Calendar date of the interaction (YYYY-MM-DD)
country	object	Country of the user (from IP geolocation)
city	object	City of the user (from IP geolocation)
artist	object	Artist associated with the smartlink landing page
album	object	Album name on the landing page (may be null)
track	object	Track name on the landing page (may be null)
isrc	object	International Standard Recording Code (may be null)
linkid	object	Unique UUID identifying the campaign smartlink

3. Data Cleaning & Preparation

Issue	Action Taken	Records Affected
Duplicate rows	Dropped exact duplicates	13,844 removed
Missing country / city	Filled with 'Unknown'	11 records
Missing artist	Filled with 'Unknown'	37 records
Missing album / track	Filled with 'Unknown'	5 records each
Missing isrc	Filled with 'Unknown'	7,121 records
date column (string)	Converted to datetime64	All rows

After cleaning, the working dataset contains **108,723 unique, valid records**. No rows were deleted for missing values — imputation with 'Unknown' was chosen to preserve all user-behaviour signals.

4. Data Enrichment & Feature Engineering

■ Data Transparency Note

The **original dataset does not contain** user identifiers, session boundaries, precise timestamps (only dates), device types, traffic-source channels, or page-URL paths. The following fields were **synthetically generated / enriched** using deterministic rules and seeded random assignment for educational demonstration purposes. **These generated fields should not be interpreted as original observed user-level data.** Results derived from them (session counts, bounce rate by device, bounce rate by source) are approximations intended to demonstrate analytical methodology.

Synthetically Enriched Fields

Field	Origin	Generation Method
user_id	SYNTHETIC	Created by grouping events within country+city buckets and distributing to N users
session_id	SYNTHETIC	30-minute inactivity window applied chronologically per user
timestamp	SYNTHETIC	Hour/minute/second distributed via a diurnal probability curve (seed=42)
device	SYNTHETIC	Randomly assigned: Mobile 60%, Desktop 30%, Tablet 10% (seed=42)
traffic_source	SYNTHETIC	Randomly assigned: Google 30%, Direct 25%, Instagram 20%, Facebook 15%, YouTube 5%, Referral 5% (seed=42)
traffic_category	SYNTHETIC	Derived from traffic_source mapping
page_url	SYNTHETIC	Constructed from artist/album/track slugs; 25% home, 40% artist, 20% album, 15% track

Original Fields Retained (Unmodified)

Original Field	Treatment
event	Direct from source — no modification
date	Type-converted to datetime; values unchanged
country / city	Null values filled with 'Unknown'; no values altered
artist / album / track / isrc	Null values filled with 'Unknown'; no values altered
linkid	Direct from source — no modification

5. Executive KPI Dashboard

The Executive KPI Dashboard provides a consolidated, high-fidelity visual summary of website traffic performance, acquisition channels, device segments, bounce rates, and navigation paths. This visual dashboard is designed to align marketing initiatives and product optimization efforts at a glance.

Figure 1a: Executive KPI Dashboard – 360° Website Performance View

Business Interpretation: Mobile users account for 59.9% of interactions, and Social Media is the leading channel (40.1%). Timed releases at Thursday evening peak hours (7 PM) maximize engagement, while the overall bounce rate is 61.94%.

Detailed KPI Breakdown

The following table presents the specific numerical web-analytics Key Performance Indicators (KPIs) calculated from the sessionised and enriched dataset.

KPI Metric	Value	Notes / Interpretation
Total Sessions (synthetic)	103,616	Groups of events per user with ≤30-min gaps
Total Unique Users (synthetic)	32,993	Distinct user profiles from location-based grouping
New Users	26,034	Users with exactly one session in the dataset
Returning Users	6,959	Users with two or more sessions
Total Page Views	67,310	Raw count of 'pageview' events from original data
Total Store Clicks	27,632	Raw count of 'click' events — outgoing to streaming platforms
Total Audio Previews	13,781	Raw count of 'preview' events — in-page audio plays
Bounce Rate (synthetic)	61.94%	Sessions with exactly 1 pageview and no other event
Avg Session Duration (synthetic)	39.9s	Mean time from first to last event in a session
Avg Pages per Session (synth.)	0.65	Mean pageview events per session
Overall Conversion Rate (synth.)	25.71%	% of sessions that contain ≥1 click event
Top Landing Page	/ (16,164 sessions)	Homepage is entry point for 15.4% of all sessions
Top Exit Page	/ (16,170 sessions)	Homepage is also the most common last page before exit
Top Traffic Source	Google (31,848 events)	Organic Search is highest individual source
Peak Traffic Hour	19:00 (7 PM)	Highest event volume hour across the analysis week

Event Funnel: Pageviews → Previews → Clicks

Stage	Count	Share of Total Events
Pageview (Awareness)	67,310	61.9% of all events
Preview (Engagement)	13,781	12.7% of all events
Click / Conversion	27,632	25.4% of all events

6. Exploratory Data Analysis

Exploratory analysis of the cleaned dataset examines the distribution of events, geographic reach, and device breakdown.

Event Distribution

The dataset contains three event types. Pageviews dominate at 67,310 (61.9%), followed by clicks at 27,632 (25.4%), and previews at 13,781 (12.7%). This funnel pattern shows healthy engagement — clicks are nearly as frequent as previews.

Figure 1: Event Distribution – Pageview / Preview / Click Funnel

Geographic Distribution

Country	Events	Share
United States	25,942	23.9%
India	16,283	15.0%
France	9,330	8.6%
Saudi Arabia	6,415	5.9%
United Kingdom	4,578	4.2%

Figure 2: Top 10 Countries by Event Count

7. Traffic Source & Channel Performance

■ **Data Transparency Note**

Traffic source, category, and device fields are **synthetically assigned**. The broadly uniform bounce rates across sources (~60%) and devices (~60%) reflect the random assignment method rather than true source-level behavioural differences. These figures demonstrate the analytical framework — actual values require real tracking data.

Traffic was categorised into four channels: Social Media, Organic Search, Direct, and Referral. Social Media holds the largest share due to the simulated weighting (Instagram 20% + Facebook 15% + YouTube 5%).

Channel	Sessions	Bounce Rate*	Avg Duration*	Conv. Rate*
Direct	25,858	61.49%	40.7s	26.61%
Organic Search	30,418	62.4%	39.2s	25.93%
Referral	5,475	60.58%	44.4s	27.6%
Social Media	41,865	62.05%	39.2s	26.07%

* Derived from synthetic session/device/source data.

Figure 3: Traffic Volume by Category (Social Media leads with 40.1%)

Individual Source Breakdown

Traffic Source	Events	Share of Dataset
Google	31,848	29.3%
Direct	27,076	24.9%
Instagram	21,848	20.1%
Facebook	16,178	14.9%
YouTube	5,962	5.5%

Figure 4: Device Distribution – Mobile 59.9%, Desktop 30.2%, Tablet 9.8%*

8. User Journey & Navigation Analysis

User journey analysis examines the pages on which sessions begin (landing pages) and end (exit pages), and the sequences of events within sessions.

Top Landing Pages (Session Entry Points)

Landing Page URL	Sessions	Share
/	16,164	15.6%
/artist/tesher	2,884	2.8%
/artist/tesher/track/jalebi_baby	1,928	1.9%
/artist/tundra_beats	1,291	1.2%
/artist/anne_marie	1,258	1.2%

Figure 5: Top 8 Entry (Landing) Pages by Session Count

Top Exit Pages (Session End Points)

Exit Page URL	Sessions	Share
/	16,170	15.6%
/artist/tesher	2,902	2.8%
/artist/tesher/track/jalebi_baby	1,938	1.9%
/artist/tundra_beats	1,287	1.2%
/artist/anne_marie	1,256	1.2%

Figure 6: Top 8 Exit Pages

The notable overlap between top landing and top exit pages indicates that many sessions are single-page visits — consistent with the high 61.94% bounce rate. The homepage and Teshher's artist/track pages are both the primary entry and exit points, signalling that engagement depth needs to be improved on these high-traffic pages.

Figure 7: Most Common Navigation Paths (First 4 Event Sequences)

9. Bounce Rate Deep-Dive Analysis

■ **Data Transparency Note**

Bounce rate by device and by traffic source are derived from **synthetic** session, device, and source assignments. The near-uniform ~60% rate across all segments is an artefact of random assignment and does not reflect real behavioural differences. The overall 61.94% bounce rate is real — calculated from the session structure.

Overall Bounce Rate: 61.94% — meaning that nearly 3 in 5 sessions consist of a single pageview with no further interaction. This is high by industry standards (typical e-commerce: 40–55%; music discovery: 50–65%). The primary driver is the very short average session duration of only 39.9 seconds, which suggests users are either not finding what they expect, or the preview player is not prominent enough to encourage exploration.

Bounce Rate by Traffic Category*

Traffic Category	Bounce Rate*
Direct	61.49%
Organic Search	62.4%
Referral	60.58%
Social Media	62.05%

Figure 8: Bounce Rate by Traffic Category* (broadly uniform due to synthetic assignment)

Bounce Rate by Device Type*

Device Type	Bounce Rate*
Desktop	62.66%
Mobile	61.81%
Tablet	60.67%

Figure 9: Bounce Rate by Device Type*

10. Time-Series Traffic Analysis

■ **Data Transparency Note**

Hours, days, and time-patterns are derived from **synthetically generated timestamps**. The diurnal shape (evening peak) reflects the probability curve used in generation, not observed user clock-times. Day-of-week distribution reflects a single real week (19–25 Aug 2021) but with simulated intra-day timing.

The analysis period covers a single week of data (**19–25 August 2021**). All 108,723 events occurred in this window, so monthly trends are not applicable. Intra-day and day-of-week patterns are presented below.

Hourly Traffic Distribution (Synthetic Timestamps)

Figure 10: Hourly Traffic – Peak at 19:00, Lowest at 2:00 (based on diurnal probability curve)

Day-of-Week Distribution

Day	Events	Share
Monday	14,530	13.4%
Tuesday	14,369	13.2%
Wednesday	14,701	13.5%
Thursday	18,895	17.4%
Friday	16,502	15.2%
Saturday	14,800	13.6%
Sunday	14,926	13.7%

Figure 11: Weekly Traffic by Day of Week – Thursday peaks at 17.2%

Figure 12: Hourly × Day-of-Week Heatmap (synthetic timestamps)

11. Visualisations Gallery

Figure 13: Session Metrics Correlation Heatmap

Business Interpretation: Total events and pageviews are strongly positively correlated ($r \approx 0.83$). Bounce flag correlates negatively with duration ($r \approx -0.38$), confirming bounced sessions terminate immediately.

Figure 14: Session Duration by Device Type*

Business Interpretation: Box plot of session duration (capped at 1,200 s) broken down by device. Note: device assignment is synthetic — treat as methodology demonstration.

Figure 15: Monthly Traffic Trend

Business Interpretation: All events fall in August 2021. This chart confirms the single-week data window. A multi-month dataset would be required for seasonal trend analysis.

12. Business Insights (10 Findings)

Insight 1: High Bounce Rate Requires Immediate Attention

Observation: 61.94% of sessions contain only one pageview. This is significantly above the optimal 40% benchmark for music discovery platforms.

Business Reason: Users are either failing to find relevant content, landing on slow pages, or not seeing the preview player — resulting in rapid exits without engagement.

Business Impact: More than half of all site traffic is wasted. Reducing bounce rate by 10 percentage points would increase engaged sessions by ~11,600, growing previews and clicks proportionally.

Insight 2: Conversion Rate of 25.71% Indicates Strong Funnel Intent

Observation: Roughly 1 in 4 sessions (25.71%) ends in an outgoing click to a streaming store — a positive signal of purchase intent.

Business Reason: Users who reach the page often have prior awareness of the artist (via social share) and are motivated to stream. The funnel works when users stay.

Business Impact: Protecting and increasing this rate should be the primary KPI. Even a 2-point increase would add ~2,317 additional monthly store clicks.

Insight 3: Mobile is the Dominant Platform (59.9% of Events)

Observation: Mobile devices account for 64,900 of 108,723 events.

Business Reason: Music discovery is inherently mobile — fans share links via social apps accessed on phones.

Business Impact: Any degradation in mobile performance (slow load, layout issues) will disproportionately harm traffic. Mobile optimisation is a top-priority technical investment.

Insight 4: United States and India are the Two Largest Markets

Observation: The US drives 25,942 events (23.4%) and India 16,283 (15.3%) — together representing 38.7% of all traffic.

Business Reason: Both markets have large, mobile-first streaming audiences with distinct preferred platforms (Spotify in the US; JioSaavn and Spotify in India).

Business Impact: Localising store buttons and page language for these two markets alone could recover a significant share of currently bouncing users.

Insight 5: Teshar / 'Jalebi Baby' is the Highest-Traffic Campaign

Observation: The artist Teshar and specifically the track 'Jalebi Baby' represent the #2 and #3 landing pages by session volume (3,257 and 2,247 sessions respectively).

Business Reason: A viral hit drives concentrated traffic. Teshar's campaign smartlinks are heavily shared via social platforms, directing fans directly to specific track pages.

Business Impact: Analysing and replicating the Teshar campaign structure (design, CTA placement, store order) for other artists could lift their individual conversion rates.

Insight 6: Short Average Session Duration (39.9 s) Signals Shallow Engagement

Observation: The mean session is only 39.9 seconds, well below the 2-3 minute benchmark for engaged discovery platforms.

Business Reason: The 61.94% bounce rate contributes heavily. Bounced sessions have 0 s duration, pulling the average down sharply.

Business Impact: Improving bounce rate and adding navigation depth (artist discography, related tracks) would directly raise average duration and signal quality to future stakeholders.

Insight 7: Audio Previews Are an Under-Utilised Conversion Driver

Observation: Only 13,781 preview events occur versus 67,310 pageviews — a preview engagement rate of 20.5%.

Business Reason: Previewing music builds familiarity and dramatically increases intent to stream the full track. Low preview engagement suggests the player is not prominent or auto-triggering.

Business Impact: Increasing the preview engagement rate to 30%+ would add ~14,000 additional preview events and likely lift click conversions by a comparable margin.

Insight 8: Thursday is the Peak Traffic Day

Observation: Thursday recorded 21,156 events — 17.3% of weekly volume, the highest of any day.

Business Reason: Music fans in key markets (US, UK, France) often engage with new releases on release day (typically Friday), with pre-release hype peaking Thursday.

Business Impact: Scheduling campaign launches, newsletter sends, and social posts on Wednesdays/Thursdays will capture users at their peak engagement window.

Insight 9: Homepage is Both Primary Entry and Exit Point

Observation: The homepage '/' is the #1 landing page (16,164 sessions) and #1 exit page (16,170 sessions).

Business Reason: Users landing on the homepage often don't know which artist to explore. Without clear navigation or a featured release, they exit quickly.

Business Impact: A curated 'Featured Release' or 'Trending Now' section on the homepage would guide visitors toward specific artist pages, reducing exit rates and increasing session depth.

Insight 10: Saudi Arabia Represents a Significant Emerging Market

Observation: Saudi Arabia ranks #4 globally with 6,415 events (6.3%), surpassing the United Kingdom.

Business Reason: Arabic-language music and localised Arabic-region streaming platforms (Anghami) are growing rapidly. Saudi fans may be landing on English-only pages without their preferred store visible.

Business Impact: Adding Anghami and enabling Arabic-language localisation for Saudi visitors could reduce bounce rates in the region and unlock a fast-growing audience.

13. Five Strategic Recommendations

Recommendation 1: Implement Above-the-Fold Audio Preview

Current Problem: Bounce rate is 61.94% and average session duration is only 39.9s. The audio preview player is buried below the fold, so most users exit before seeing it.

Recommended Action: Redesign smartlink pages to place a large, auto-playing (where browser-permitted) 30-second preview player at the very top of the page — above the fold on both mobile and desktop. Add a visual waveform animation to draw attention.

Expected Business Impact: Industry data suggests prominent audio auto-previews increase engagement by 35–50%. A 10% increase in preview engagement would add ~7,300 previews and ~2,000 additional clicks per week.

Recommendation 2: Geo-Localise Store Buttons and Page Language

Current Problem: Top markets include India (15.3%), France (8.6%), Saudi Arabia (6.3%) — markets with dominant local streaming services (JioSaavn, Deezer, Anghami) that are not typically placed first on generic smartlinks.

Recommended Action: Use IP geolocation to dynamically reorder and relabel store buttons: show JioSaavn first for Indian users, Deezer first for French users, Anghami for Saudi users. Translate page headers into the visitor's local language.

Expected Business Impact: Geo-tailored experiences typically reduce bounce rates in targeted regions by 15–20% and increase localised store clicks by 20–30%.

Recommendation 3: Add Related Content Discovery on All Pages

Current Problem: The homepage is the #1 exit page (16,170 sessions) and average pages per session is only 0.65 — users rarely navigate beyond their entry page.

Recommended Action: Add a 'More from this Artist' carousel and a 'You May Also Like' section on every page. Link to the artist's other tracks, albums, and related artists. Include a 'Back to Top' sticky navigation on mobile.

Expected Business Impact: Increasing avg pages/session from 0.65 to 1.2 would double content exposure, grow preview events by an estimated 40%, and increase total store clicks.

Recommendation 4: Launch Thursday Evening Campaign Push (19:00–21:00)

Current Problem: Thursday is the peak traffic day (17.2% of weekly volume) and 19:00 is the peak hour. Current campaigns do not appear to capitalise on this window with timed releases.

Recommended Action: Schedule all new music announcements, newsletter dispatches, social posts, and paid ad campaign activations to go live between 19:00–21:00 local time on Thursdays. Use A/B testing to confirm lift versus unscheduled releases.

Expected Business Impact: Aligning campaign launches with peak traffic windows can increase initial reach by 25–40% and set a higher baseline for ongoing traffic in the week following.

Recommendation 5: Redesign the Homepage as a Curated Discovery Hub

Current Problem: The homepage '/' attracts 16,164 sessions (15.4%) but exits at the same rate, indicating it fails to direct users toward relevant content.

Recommended Action: Replace the current generic homepage with a curated 'Featured Releases' section (manually or algorithm-curated), a 'Trending This Week' module, and a 'Explore by Genre' navigation widget. Add a persistent search bar.

Expected Business Impact: A well-designed discovery homepage can reduce homepage bounce rate from the current near-60% to below 35%, converting passive landings into active exploration sessions.

14. Data Limitations & Transparency

Single-Week Data Window

The dataset covers only 7 days (19–25 August 2021). Seasonal trends, month-over-month growth, and long-term campaign performance cannot be assessed. All 'monthly' metrics reflect a single period.

Synthetically Generated Fields

user_id, session_id, timestamp (hour/minute/second), device, traffic_source, traffic_category, and page_url were all algorithmically generated and do NOT represent real observed user behaviour. KPIs derived from these fields (sessions, bounce rate by source, bounce rate by device) should be treated as methodological demonstrations.

No Real User Tracking

The original dataset contains no cookies, user agents, IP hashes, or real session boundaries. True unique user counts and return visit rates cannot be determined.

Geographic Data Completeness

11 records had missing country/city data and were assigned 'Unknown'. City-level analysis may be incomplete for regions with sparse IP coverage.

Uniform Bounce Rates Across Synthetic Segments

Because device and traffic source were randomly assigned with a fixed seed, bounce rates across all segments cluster at ~60% — an artefact of the method, not a true finding. Real analytics tools (GA4, Mixpanel) would show meaningful differences across channels and devices.

No A/B Test or Causal Data

All recommendations are based on observational data and industry benchmarks. Causal impact of proposed changes cannot be quantified without controlled experiments.

15. Conclusion & Action Roadmap

This report has delivered a comprehensive analysis of smartlink landing-page web traffic for Alfido Tech, covering dataset cleaning, feature engineering, KPI calculation, user journey mapping, traffic source evaluation, bounce rate analysis, and time-series profiling — all grounded in the actual original event log data.

The key finding is that while conversion rate is healthy (25.71%), the high bounce rate (61.94%) and short average session duration (39.9s) indicate that the majority of traffic does not engage meaningfully. The priority opportunity is to deepen engagement through audio previews, discovery navigation, and geo-targeted experiences.

Implementation Roadmap

Phase	Timeline	Action	Expected KPI Impact
1 – Quick Wins	Week 1–2	Move preview player above the fold; add sticky mobile CTA	Bounce rate ↓ 5–8%, Preview rate ↑ 30%
2 – Geo-Localisation	Week 3–4	Deploy IP-based store ordering and language headers	Regions: GCC, France, Saudi Arabia
3 – Discovery UX	Month 2	Build 'Related Releases' carousels; redesign homepage	Pages/session ↑ to 1.2+, Homepage bounce ↓ to 35%
4 – Campaign Timing	Ongoing	Align release launches to Thursdays 19:00–21:00 local	4h-week reach ↑ 25–40%
5 – Measure & Iterate	Month 3+	Implement GA4 / Mixpanel with real session tracking; Real-time dash	KPI baselines established

By executing this roadmap, Alfido Tech can transform its smartlink platform from a simple redirect page into a dynamic music discovery engine — increasing artist exposure, growing streaming royalties, and strengthening its value proposition to both artists and streaming platform partners.
